

I'm not robot!

The documentation set for this product strives to use bias-free language. For the purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product. Learn more about how Cisco is using Inclusive Language. Oracle offers a Free Tier with no time limits on more than 20 services, such as Networking, Compute, Storage, and Autonomous Database. Get US\$300 in free credits to try additional cloud services. Get the details and sign up for your free account today. 10 TB outbound data transfer per month 200 GB total block storage 10 GB object storage 2 Autonomous Databases, 20 GB each AMD and Arm Compute VMs 20+ more Always Free Services US\$300 in free credits for 30 days for even more Preparing for an Oracle certification exam will assess and challenge your ability to think and perform. Earning a highly recognized and valued Oracle certification will improve your job prospects and stability, accelerating your career growth. Expand your knowledge base and skills Improve your potential earning power Learn to perform complex, hands-on activities Explore OCI features, functions, and tasks Oracle Cloud pricing is simple, with consistent low pricing worldwide, supporting a wide range of use cases. To estimate your low rate, check out the cost estimator and configure the services to suit your needs. Global first 10TB/month free Outbound data over 10TB/month starting at US\$0.0085 Interested in learning more about Oracle Cloud Infrastructure? Let one of our experts help. How do I get started with Oracle Cloud? What kinds of workloads can I run on OCI? What types of services does OCI offer? First, use the Mobile VPN with IPsec Wizard to configure the basic settings: Select VPN > Mobile VPN > IPsec. The Mobile VPN with IPsec Configuration dialog box appears. Click Add. The Add Mobile VPN with IPsec Wizard appears. Click Next. The Select a user authentication server page appears. From the Authentication Server drop-down list, select an authentication server. You can authenticate users to the Firebox (Firebox-DB) or to a RADIUS, VASCO, SecurID, LDAP, or Active Directory server. Make sure that the method of authentication you select is enabled. In the Group Name text box, type the name of the authentication group your macOS or iOS device users belong to. You can type the name of a Mobile VPN group you have already created, or type a group name for a new Mobile VPN group. Make sure the name is unique among VPN group names, as well as all interface and tunnel names. If you create a Mobile VPN user group that authenticates to an external authentication server, make sure you create a group on the server with the same name you specified in the wizard for the Mobile VPN group. If you use Active Directory as your authentication server, the users must belong to an Active Directory security group with the same name as the group name you configure for Mobile VPN with IPsec. For more information, see Configure the External Authentication Server. Click Next. The Select a tunnel authentication method page appears. Select Use this passphrase. Type and confirm the passphrase. Click Next. The Direct the flow of Internet traffic page appears. Select Yes, force all Internet traffic to flow through the tunnel. This configures the tunnel for default-route VPN (0.0.0.0/0). The VPN client on the macOS or iOS device does not support split tunneling. Click Next. The Identify the resources accessible through the tunnel page appears. For a default-route VPN configuration, the configuration automatically allows access to all network IP addresses and the Any-External alias. Click Next. The Create the virtual IP address pool page appears. To add one IP address or an IP address range, click Add. To add more virtual IP addresses, repeat this step. Mobile VPN users are assigned an IP address from the virtual IP address pool when they connect to your network. The number of IP addresses in the virtual IP address pool should be the same as the number of Mobile VPN users. If a FireCluster is configured, you must add two virtual IP addresses for each Mobile VPN user. The virtual IP addresses must be on a different subnet than the local networks. The virtual IP addresses cannot be used for anything else on your network. Click Next. To add users to the new Mobile VPN with IPsec group, select the Add users check box. Click Finish. The Mobile VPN configuration you created appears in the Mobile VPN with IPsec Configuration dialog box. Next, you must edit the VPN Phase 1 and Phase 2 settings to match the settings for the VPN client on the macOS or iOS device. In the Mobile VPN with IPsec Configuration dialog box, select the configuration you just added. Click Edit. The Edit Mobile VPN with IPsec dialog box appears. Select the IPsec Tunnel tab. From the Authentication drop-down list, select an authentication method. From the Encryption drop-down list, select an encryption method. Click the Advanced button in the Phase 1 Settings section. The Phase1 Advanced Settings dialog box appears. Set the SA Life to 1 hour. The VPN client on the macOS or iOS device is configured to rekey after 1 hour. If this profile is only used for connections by VPN clients on macOS or iOS devices, set the SA Life to 1 hour to match the client setting. To use this VPN profile for all supported VPN clients, set the SA Life to 8 hours. When the SA Life is set to 8 hours, WatchGuard IPsec Mobile VPN clients rekey after 8 hours, but the VPN client on the macOS or iOS device uses the smaller rekey value of 1 hour. From the Key Group drop-down list, select Diffie-Hellman Group 14 or Diffie-Hellman Group 2. Do not change any of the other Phase 1 Advanced Settings. Click OK. In the Phase 2 Settings section, click Proposal. From the Authentication drop-down list, select MD5 or SHA1. SHA2 is not supported for Phase 2 for Mobile VPN with IPsec connections from macOS and iOS devices. From the Encryption drop-down list, select an encryption method. Set the Force Key Expiration to 1 hour and 0 kilobytes. In the Force Key Expiration settings, set the expiration Time to 1 hours. In the Force Key Expiration settings, clear the Traffic check box. Click OK. In the Edit Mobile VPN with IPsec dialog box, clear the PFS check box. Perfect Forward Secrecy is not supported by the VPN client on the iOS device. Click the Advanced tab. (Fireware v12.2.1 or higher) Configure the DNS settings: Assign the network DNS/WINS settings to mobile clients If you select this option, mobile clients receive the DNS and WINS settings you specify at Network > Interfaces > DNS/WINS. For example, if you specify the DNS server 10.0.2.53 in the Network DNS/WINS settings, mobile VPN clients use 10.0.2.53 as a DNS server. By default, the Assign the Network DNS/WINS Server settings to mobile clients setting is selected for new mobile VPN configurations. Do not assign DNS or WINS settings to mobile clients If you select this option, clients do not receive DNS or WINS settings from the Firebox. Assign these settings to mobile clients If you select this option, mobile clients receive the domain name, DNS server, and WINS server settings you specify in this section. For example, if you specify example.com as the domain name and 10.0.2.53 as the DNS server, mobile clients use example.com for unqualified domain names and 10.0.2.53 as the DNS server. You can specify one domain name, up to two DNS server IP addresses, and up to two WINS server IP addresses. For more information about DNS and WINS server settings for Mobile VPN with IPsec users, see Configure DNS and WINS Servers for Mobile VPN with IPsec. Click OK. Save the configuration file to your Firebox. Make sure that the macOS or iOS users are members of the authentication group you selected. Next, you add the settings you configured on your Firebox to the VPN client settings on the macOS or iOS device. " - [Instructor] We use an IPsec site-to-site VPN when a company has branch offices that need to communicate with one another. In order to configure a Cisco IOS command line interface-based site-to-site IPsec VPN, there are five major steps. Make sure that all the access control lists on all devices in the pathway for the IPsec VPN, such as routers, firewalls, and other devices are compatible with IPsec. Create a logical drawing so that you can trace and check each device. Although this might take a little time to complete, it will save you time in preventing any conflicts with access control lists. Internet key exchange phase one. ISAKMP policy configuration using the crypto ISAKMP policy command to set the parameters used when establishing the internet key exchange phase one tunnel. In addition, configure the pre-shared key. Within the ISAKMP configuration mode, configure the following: encryption, hash, authentication algorithms, Diffie-Hellman group, and lifetime. The resulting... Watch courses on your mobile device without an internet connection. Download courses using your iOS or Android LinkedIn Learning app.
